Received 31 January 2007, in revised form 12 March 2007

Abstract. The volatile constituents from roots of *Valeriana officinalis* L. were investigated using GC and GC/MS methods. *Valerianae radix* samples were obtained from retail pharmacies or cultivated in Estonia. The roots of five *V. officinalis* samples yielded 0.28–1.16% essential oil in the cut drug, which usually corresponded (four samples) to the European Pharmacopeia standard (0.3%). The basic oil components among the identified 84 compounds were isovaleric acid (0–2.1%), α-pinene (0.4–3.6%), α-fenchene (0.6–5.8%), camphene (0.6–5.9%), bornyl acetate (8.8–33.7%), myrtenyl acetate (2.0–7.2%), alloaromadendrene (0.3–7.6%), myrtenyl isovalerate (1.1–2.5%), spathulenol (0.7–4.1%), sesquiterpene alcohol (0.8–6.6%), valerianol (0.3–16.7%), valeranone (0.5–9.4%), and valerenal (tr–14.7%). Valerian root oil from Estonia (four samples) was rich in bornyl acetate and valerenal. Bornyl acetate, valerianol, and valeranone dominated in one Estonian sample.

Key words: *Valeriana officinalis* L., essential oil, bornyl acetate, valerenal, valerianol, valeranone.

INTRODUCTION

Valerian (*Valeriana officinalis* L.) is a well-known and frequently used medicinal plant, which has a long proven history of efficacy. The plant is cultivated as a medicinal plant on a commercial scale in the northern parts of Europe and America. Valerian has been shown to encourage sleep, improve sleep quality, and reduce blood pressure [1]. The valerian root is sedative, mild anodyne, hypnotic, antispasmodic, carminative, and hypotensive. Traditionally, it has been used for hysterical states, excitability, insomnia, hypochondriasis, migraine, cramp, intestinal colic, rheumatic pains, etc. Modern interest in valerian preparations is

* Corresponding author, aorav@chemnet.ee

focused on their use as a sedative and hypnotic [2, 3]. The *Valerianae radix* is often used as a milder alternative or a possible substitute for the stronger synthetic sedatives in the treatment of states of nervous excitation and anxiety-induced sleep disturbances [4]. The dried roots attract rats and cats, it can be used as a bait to lure them away from other areas. The essential oil from the leaves and roots is used as a flavouring in ice cream, baked goods, condiments, etc. [1].

The sedative activity of valerian root has been attributed to both the essential oil and iridoid valepotriate fractions [2]. The drug of the European Pharmacopoeia (EP) *Valerianae radix* contains not less than 5 mL/kg of essential oil for the whole drug and not less than 3 mL/kg (~0.3%) of essential oil for the cut drug, both calculated with reference to the dried drug [5]. The oil content of *V. officinalis* has been reported to vary from 0.1% to 2% [2, 6–11].

The composition of valerian root oil has been considerably studied [7–21]. The typical constituents of valerian roots are found to be valeric and isovaleric acid, monoterpenes (α-pinene, α-fenchene, camphene), monoterpenic esters (bornyl acetate, myrtenyl acetate, myrtenyl isovaleriate), oxygen containing sesquiterpenes, and valerian cyclopentanoid sesquiterpenes such as valerenal, valerenone, valerenol, valerenyl acetate, valerenic acid, and valerenyl isovalerate.

The valepotriates with rather unstable epoxide structures may be present in the root, but are generally absent from finished products. The essential oil and some compounds isolated from it (valerenic acid, valerenal, valeranone), injected intraperitoneally, show central depressive and/or muscle relaxant activity in mice [3].

The aim of this study was to determine the composition of the essential oil from *Valerianae radix* samples from Estonia. The variation in the content of the biologically active constituents was studied. The quality of Estonian valerian roots compared to the EP requirements was determined.

EXPERIMENTAL

Materials

Plant materials, *Valeriana officinalis* L. roots, were obtained from retail pharmacies or cultivated in Estonia in 2000 (sample 1 – cultivated in Järvamaa, local cultivar), in 2002 (sample 2 – cultivated in Tartumaa, seeds from the company CN Seeds, UK; and sample 3 – Vadi Gild OÜ, Põlvamaa), in 2003 (sample 4 – Energia farm, Viljandimaa), and in 2005 (sample 5 – Vadi Gild OÜ, Põlvamaa). Voucher specimens are deposited at the Institute of Pharmacy, University of Tartu, Estonia.

Isolation of essential oil

The essential oil was isolated from dried valerian roots by the distillation method described in the European Pharmacopoeia [5] using 40 g of crushed roots, a 2000 mL round-bottomed flask, and 500 mL of water as the distillation

liquid. Xylene (0.5 mL in a graduated tube) was added to take up the essential oil. The distillation time was 4 h at a rate of 3–4 mL/min.

Capillary gas chromatography

A Chrom 5 chromatograph with FID on two fused silica capillary columns with bonded stationary phases SPB-5 (30 m × 0.25 mm, Supelco) and SW-10 (30 m × 0.25 mm, Supelco) was used to carry out GC analysis. The film thickness of both stationary phases was 0.25 μm. Helium with a split ratio of 1 : 150 and flow rate of 30–35 cm/s was applied as the carrier gas. The temperature program was from 50 to 250 °C at 2 °C/min, the injector temperature was 200 °C. A Spectra-Physics SP 4100 computing integrator was used for data processing.

The oil components were identified by comparing their retention indices (RI) on two columns with the RI values of reference standards, our RI data bank, and literature data [6, 8, 10, 11, 20, 22, 23]. The percentage composition of the oils was calculated in peak areas using the normalization method without correction factors. The relative standard deviation of the percentages of the oil components of three repeated GC analyses of single oil samples did not exceed 5%.

Gas chromatography/mass spectrometry

GC/MS analysis was carried out using GCMS-QP2010 (Shimadzu, Japan) on a fused silica capillary column (30 m × 0.32 mm) with a bonded stationary phase: poly(5%-diphenyl-95%-dimethyl)siloxane) (ZB-5, Zebron). The film thickness of the stationary phase was 0.25 μm. The carrier gas was helium with the split ratio of 1 : 17, and the flow rate of 1.8 mL/min was applied. The temperature program was 2 min at 60 °C and then from 60 to 280 °C at 12 °C/min. The injector temperature was 280 °C.

RESULTS AND DISCUSSION

The identified compounds in the essential oils of five valerian samples from Estonia, and the range and mean % content and variation coefficients are presented in Table 1. High variation coefficients of the majority of compounds (>1) show that the content of these compounds strongly differs from sample to sample. Low variation coefficients (0.41–0.63) are seen for bornyl acetate, α-terpinyl acetate, (E)-β-caryophyllene, myrtenyl isovalerate, sesquiterpene alcohols, α-bisabolol, valerenal, etc. These compounds were identified in all the samples studied.

The essential oil yield for the five samples of valerian roots from Estonia varied between 0.28% and 1.16% (Table 2). In the EP [5] an essential oil content of *Valerianae radix* of at least 0.3% for cut drug is required. The oil content of *V. officinalis* has been reported to vary from 0.1% to 2% [6, 8–11]. The content of essential oil did not correspond to the EP standard in sample 4.

[a] Below the minimum limit of EP (0.3% for the cut drug).

A total of 84 compounds, representing more than 93% of the total oil, were identified in the valerian samples studied. All the identified components have been reported previously in *V. officinalis* root oil [6, 8–11, 13–21]. It was possible to determine the compound group for nine peaks only by mass spectral data. Three unknown sesquiterpene alcohols with the same mass fragmentation pattern were detected (the $[M^+]$ at m/z 220 and characteristic peaks at m/z 43 (base peak)), 91, 105, 41, 93, 79, 119, and 107).

The basic oil components were isovaleric acid (0–2.1%), α-pinene (0.4–3.6%), α-fenchene (0.6–5.8%), camphene (0.6–5.9%), bornyl acetate (8.8–33.7%), myrtenyl acetate (2.0–7.2%), alloaromadendrene (0.3–7.6%), myrtenyl isovalerate (1.1–2.5%), spathulenol (0.7–4.1%), sesquiterpene alcohol (0.8–6.6%), valerianol (0.3–16.7%), valeranone (0.5–9.4%), valerenal (tr–14.7%), and valerenic acid (0–0.9%) (Table 2).

In four Estonian samples (2–5) bornyl acetate and valerenal dominated. These compounds were found to be the main compounds in valerian root oils in earlier studies [7–11, 16] too. Valeranone was the main compound in samples 1 and 4. The content of valerianol was highest in sample 1. A high content of valerianol was found in oil of *V. officinalis* roots from Serbia [16] and in some samples from The Netherlands [8]. Samples 4 and 5 from Estonia were comparatively rich in monoterpenic hydrocarbons α-fenchene and camphene (total 1.2–11.7%). Oil rich in monoterpenes (α-pinene, camphene, α-fenchene) was isolated from valerian roots in Switzerland [6]. The main sesquiterpene alloaromadendrene dominated in Estonian samples 2 and 3.

CONCLUSIONS

Several chemotypes of the essential oil of valerian roots have been distinguished earlier in the literature [8, 11], e.g. a valerianol type, and valeranone, cryptofauronol, and valerenal types. Valerian root oil from Estonia (four samples) was also rich in bornyl acetate and valerenal. Bornyl acetate, valerianol, and valeranone dominated in one Estonian sample. The *Valerianae radix* cultivated in Estonia usually (four samples) corresponds to the EP standards in the aspect of the essential oil contents.

Eeterliku õli koostise varieeruvus Eestist pärineva *Valeriana officinalis* L. juurtes

Ain Raal, Anne Orav, Elmar Arak, Tiiu Kailas ja Mati Müürisepp

On uuritud hariliku palderjani (*Valeriana officinalis* L.) juurte lenduvaid ühendeid, kasutades GC- ja GC/MS-meetodit. Droogi *Valerianae radix* näidised on saadud jaemüügiapteekidest või kultiveeritud Eestis. Uuritud viies palderjani peenestatud droogis on eeterliku õli sisaldus 0,28–1,16%, neljas droogiproovis vastab see Euroopa farmakopöa eeterliku õli sisalduse standardnõudele (0,3%). 84 identifitseeritud komponendi hulgas on põhikomponentideks isopalderjanhape (0–2,1%), α-pineen (0,4–3,6%), α-fenheen (0,6–5,8%), kamfeen (0,6–5,9%), bornüülatsetaat (8,8–33,7%), mürtenüülatsetaat (2,0–7,2%), alloaromadendreen (0,3–7,6%), mürtenüülisovaleraat (1,1–2,5%), spatulenool (0,7–4,1%), seskviterpeenne alkohol (0,8–6,6%), valerianool (0,3–16,7%), valeranoon (0,5–9,4%) ja valerenaal (jälgedes – 14,7%). Eestist pärinevate palderjanijuurte eeterlik õli (neli droogiproovi) on rikas bornüülatsetaadi ja valerenaali sisalduselt. Ühes droogiproovis domineerivad bornüülatsetaat, valerianool ja valeranoon.
