**Abstract.** We give a characterization of matrix methods which map a separable  $BK$ -space into the space of  $A$ -statistically convergent bounded sequences, where  $A$  is a given non-negative regular matrix.

**Key words:** summability, matrix methods, statistical convergence.

## 1. INTRODUCTION AND PRELIMINARY RESULTS

Let  $\mathbb{N}$  be the set of natural numbers and let  $s$  be the vector space of all complex (or real) sequences  $x = (x_k) = (x_k)_{k \in \mathbb{N}}$ . A linear subspace  $X$  of  $s$  is called a sequence space. If all sequences  $x = (x_k) \in X$  are convergent to a limit  $X\text{-}\lim_k x_k$ , then we say that the sequence space  $X$  is equipped with the limit  $X\text{-}\lim$ . A Banach sequence space  $X$  is called a  $BK$ -space if all coordinate functionals  $f_k$ ,  $f_k(x) = x_k$ , are continuous on  $X$ . The well-known  $BK$ -spaces are

$$m = \{x = (x_k) \in s : \|x\|_\infty = \sup_k |x_k| < \infty\},$$

$$l^p = \left\{ x = (x_k) \in s : \|x\|_p = \left( \sum_{k=1}^{\infty} |x_k|^p \right)^{\frac{1}{p}} < \infty \right\}$$

for  $1 \leq p < \infty$  and the subspace

$$c = \{x = (x_k) \in s : \exists \lim_k x_k\}$$

of  $m$ .

Let  $A = (a_{nk})$  be an infinite complex matrix. If the series

$$A_n x = \sum_k a_{nk} x_k = \sum_{k=1}^{\infty} a_{nk} x_k \quad (n \in \mathbb{N})$$

converge and there exists a limit  $\lim_n A_n x = l$ , then the sequence  $x$  is called  $A$ -limitable to  $l$ . For two sequence spaces  $X$  and  $Y$  we say that the

matrix  $A$  maps  $X$  into  $Y$  if the transformed sequence  $Ax = (A_n x)$  exists and belongs to  $Y$  for each  $x \in X$ . By the symbol  $(X, Y)$  we denote the set of all matrices which map  $X$  into  $Y$ . If  $X$  and  $Y$  are equipped with the limits  $X\text{-lim}$  and  $Y\text{-lim}$ , respectively,  $A \in (X, Y)$  and  $Y\text{-lim}_n A_n x = X\text{-lim}_k x_k$  for all  $x \in X$ , then we say that  $A$  regularly maps  $X$  into  $Y$  and write  $A \in (X, Y)_{\text{reg}}$ . The matrices (or matrix methods)  $A \in (c, c)_{\text{reg}}$  are called regular.

The next three theorems follow immediately from the principle of uniform boundedness and the Banach–Steinhaus theorem.

**Theorem A.** *Let  $X$  be a BK-space and  $B = (b_{nk})$  an infinite matrix. Then  $B \in (X, m)$  if and only if*

$$1^0 \quad \sup_n \|B_n\| < \infty,$$

where the functional  $B_n$  on  $X$  is defined by  $B_n x = \sum_k b_{nk} x_k$ .

**Theorem B.** *Let  $X$  be a BK-space and  $\Phi$  a fundamental set of  $X$ . Then  $B \in (X, c)$  if and only if the conditions  $1^0$  and*

$$2^0 \quad \exists \lim_n B_n x \quad (x \in \Phi)$$

are satisfied.

**Theorem C.** *Let  $X$  be a BK-space equipped with the limit  $X\text{-lim}$  and let  $\Phi$  be a fundamental set of  $X$ . If the functional  $X\text{-lim}$  is linear and continuous in  $X$ , then  $B \in (X, c)_{\text{reg}}$  if and only if the conditions  $1^0$  and*

$$2^{00} \quad \lim_n B_n x = X\text{-lim } x_k \quad (x = (x_k) \in \Phi)$$

are fulfilled.

In the case of  $X = c$  Theorem C gives the well-known theorem of Silverman and Toeplitz.

**Theorem D.** *The matrix (or matrix method)  $A$  is regular if and only if*

$$(R1) \quad \sup_n \sum_k |a_{nk}| < \infty,$$

$$(R2) \quad \lim_n a_{nk} = 0 \quad (k \in \mathbb{N}),$$

$$(R3) \quad \lim_n \sum_k a_{nk} = 1.$$

By an index set we mean a subset  $\{k_i\}$  of  $\mathbb{N}$  with  $k_i < k_{i+1}$ . The index set  $K$  is called asymptotically equal to the index set  $L$ , briefly  $K \sim L$ , if the symmetric difference of sets  $K$  and  $L$  is finite.

For a non-negative regular matrix  $A = (a_{nk})$ , following Freedman and Sember [1], an index set  $K = \{k_i\}$  will be said to have  $A$ -density  $\delta_A(K)$  equal to  $r$ , if

$$\lim_n \sum_i a_{nk_i} = r.$$

A density  $\delta$  is said to have property AP0 (additivity property for sets of zero density) if for every system of sets  $K_i$  ( $i \in \mathbb{N}$ ) with  $\delta(K_i) = 0$  there exist the sets  $L_i$  ( $i \in \mathbb{N}$ ) such that  $L_i \sim K_i$  and  $\delta(\cup_i L_i) = 0$ . The following result was proved by Freedman and Sember ([1], Proposition 1.2).

**Lemma E.** The  $A$ -density  $\delta_A$  has the property AP0.

The notion of statistical convergence was introduced by Fast [2] and has been generalized by the author [3, 4] and Connor [5] in the following way. A sequence  $x = (x_k)$  is called  $A$ -statistically convergent to a number  $l$  if for every  $\varepsilon > 0$  the  $A$ -density of the set  $\{k : |x_k - l| \geq \varepsilon\}$  is equal to zero. If  $A$  is the Cesàro matrix  $C_1$ , this definition reduces to Fast's definition of statistical convergence. By  $st(A)$  we denote the set of all  $A$ -statistically convergent sequences.

The notion of  $A$ -statistical convergence generalizes the usual convergence. A sequence  $x = (x_k)$  converges to  $l$  if and only if for every  $\varepsilon > 0$  the index set  $\{k : |x_k - l| \geq \varepsilon\}$  is finite. But by (R2) the  $A$ -density of an arbitrary finite index set is equal to zero. So  $st(A) \supset c$ .

Our considerations are essentially based on the following characterization of  $A$ -statistical convergence, proved for  $A = C_1$  by Šalát ([6], Lemma 1.1) and Fridy ([7], Theorem 1) and for arbitrary non-negative regular  $A$  by the author ([3], Theorem 1; [4], Theorem 2.3).

**Theorem F.** A sequence  $x = (x_k)$  converges  $A$ -statistically to  $l$  if and only if there exists an infinite index set  $K = \{k_i\}$  so that  $\delta_A(K) = 1$  and  $\lim_i x_{k_i} = l$ .

This theorem says that  $B \in (X, st(A))$  if and only if for every  $x \in X$  there is an index set  $N = N(x) = \{n_i\}$  so that  $\delta_A(N) = 1$  and exists  $\lim_i B_{n_i} x$ . So, if  $^{[N]}B = (d_{nk})$ , where for all  $k \in \mathbb{N}$

$$d_{nk} = \begin{cases} b_{nk}, & \text{if } n \in N \\ 0, & \text{otherwise,} \end{cases}$$

we can formulate the following lemma.

**Lemma G.** Let  $X$  be a sequence space and  $A$  a non-negative regular matrix. Then  $B \in (X, st(A))$  if and only if for every  $x \in X$  there exists an index set  $N$  so that  $\delta_A(N) = 1$  and  $^{[N]}Bx \in c$ .

In [8] the matrix class  $(st(A) \cap X, Y)$  for certain sequence spaces  $X$  and  $Y$  was studied. In this paper we characterize the matrix classes  $(X, st(A) \cap m)$  and  $(X, st(A) \cap m)_{reg}$  for a separable  $BK$ -space  $X$ .

## 2. MAIN RESULTS

Now we characterize the matrix class  $(X, st(A) \cap m)$ .

**Theorem 1.** Let  $X$  be a separable  $BK$ -space and  $\Phi$  a countable fundamental set of  $X$ . Then  $B \in (X, st(A) \cap m)$  if and only if the conditions  $1^0$  and

$$3^0 \quad \exists N = \{n_i\}, \delta_A(N) = 1, [^N]Bx \in c \quad (x \in \Phi)$$

are satisfied.

*Proof.* Since  $B \in (X, st(A) \cap m)$  if and only if  $B \in (X, m)$  and  $B \in (X, st(A))$ , then the necessity and sufficiency of  $1^0$  follows from Theorem A.

If  $3^0$  (together with  $1^0$ ) is true, then by Theorem B we have  $[^N]B \in (X, c)$  and thus, by Lemma G, we get  $B \in (X, st(A))$ .

Conversely, if  $B \in (X, st(A))$  and  $\Phi = \{\varphi_i\}$ , again by Lemma G we shall find the index sets  $K_i \quad (i \in \mathbb{N})$  so that  $\delta_A(K_i) = 1$  for all  $i \in \mathbb{N}$  and

$$[^{K_i}]B\varphi_i \in c \quad (i \in \mathbb{N}). \quad (1)$$

Then  $\delta_A(K'_i) = 0$ , where  $K'_i = \mathbb{N} \setminus K_i$ . Since by Lemma E the  $A$ -density has the property AP0, we can find index sets  $N'_i$  such that  $N'_i \sim K'_i$  and  $\delta_A(\cup_i N'_i) = 0$ . If we now denote  $N_i = \mathbb{N} \setminus N'_i$  and  $N = \cap_i N_i$ , then by  $N = \mathbb{N} \setminus (\cup_i N'_i)$  we have  $\delta_A(N) = 1$ . Since  $N'_i \sim K'_i$  implies  $N_i \sim K_i$ , then from (1) it follows that

$$[^{N_i}]B\varphi_i \in c \quad (i \in \mathbb{N})$$

which gives

$$[^N]B\varphi_i \in c \quad (i \in \mathbb{N})$$

by  $N \subset N_i \quad (i \in \mathbb{N})$ . Consequently  $3^0$  is fulfilled and the proof is completed.

Analogously, using only Theorem C instead of Theorem B, we can prove the following characterization of the matrix class  $(X, st(A) \cap m)_{\text{reg}}$ .

**Theorem 2.** *Let  $X$  be a separable  $BK$ -space equipped with a continuous linear limit  $X$ -lim and let  $\Phi$  be a countable fundamental set of  $X$ . Then  $B \in (X, st(A) \cap m)_{\text{reg}}$  if and only if the conditions  $1^0$  and*

$$3^{00} \quad \exists N \subset \mathbb{N}, \delta_A(N) = 1, \lim_n [^N]B_n x = X\text{-lim } x_k \quad (x \in \Phi)$$

hold.

Finally we formulate some corollaries for the particular cases  $X = c$  and  $X = l^p$ . For the  $BK$ -space  $c$  the sequences  $e = (1, 1, \dots)$  and  $e^k = (0, 0, \dots, 0, 1, 0, \dots)$ , where 1 is in the  $k$ th position, form a fundamental set. Since the norm of the functional  $B_n$  on  $c$  is equal to

$$\|B_n\| = \sum_k |b_{nk}|,$$

we get the following two results from Theorems 1 and 2.

**Corollary 3.**  *$B \in (c, st(A) \cap m)$  if and only if*

- (i)  $\sup_n \sum_k |b_{nk}| < \infty$
- and there exists  $N = \{n_i\}$  so that  $\delta_A(N) = 1$  and
- (ii)  $\exists \lim_i b_{n_i k} = b_k \quad (k \in \mathbb{N})$ ,
- (iii)  $\exists \lim_i \sum_k b_{n_i k} = b$ .

**Corollary 4.**  $B \in (c, st(A) \cap m)_{\text{reg}}$  if and only if the conditions (i) and (ii), (iii) with  $b_k = 0, b = 1$  are satisfied.

The  $BK$ -space  $l^p, 1 \leq p < \infty$ , has the fundamental set  $\Phi = \{e^k : k \in \mathbb{N}\}$  and

$$\|B_n\| = \begin{cases} \left(\sum_k |b_{nk}|^q\right)^{\frac{1}{q}}, & \text{if } p > 1, \\ \sup_k |b_{nk}|, & \text{if } p = 1, \end{cases}$$

where  $\frac{1}{p} + \frac{1}{q} = 1$ . Thus from Theorem 1 we get two more results.

**Corollary 5.** For  $1 < p < \infty$  we have  $B \in (l^p, st(A) \cap m)$  if and only if  $\sup_n \sum_k |b_{nk}|^q < \infty$  ( $\frac{1}{p} + \frac{1}{q} = 1$ ) and (ii) holds.

**Corollary 6.**  $B \in (l^1, st(A) \cap m)$  if and only if  $\sup_{n,k} |b_{nk}| < \infty$  and (ii) is satisfied.

Let  $E$  be the unit matrix. It is clear that  $st(E) = c$  and that  $\delta_E(N) = 1$  is equivalent to  $N \sim \mathbb{N}$ . So for  $A = E$  Corollary 4 reduces to the Silverman–Toeplitz theorem (Theorem D) and Corollaries 3, 5, 6 reduce to the known characterizations of matrix classes  $(c, c)$ ,  $(l^p, c)$  and  $(l^1, c)$ , respectively (see, for example, [9]).

# MAATRIKSTEISENDUSED STATISTILISELT KOONDUVATE TÕKESTATUD JADADE RUUMI

Enno KOLK

Olgu  $A = (a_{nk})$  lõpmatu arvmaatriks. Arvu  $r$  nimetatakse naturaalarvude hulga osahulga  $K$   $A$ -tiheduseks, kui  $\lim_n \sum_{k \in K} a_{nk} = r$ . Öeldakse, et arvjada  $x = (x_k)$  koonduv  $A$ -statistiliselt arvuks  $l$ , kui iga  $\epsilon > 0$  korral hulga  $\{k : |x_k - l| \geq \epsilon\}$   $A$ -tihedus võrdub nulliga. Varasemas artiklis on vaadeldud maatriksteisendusi, mis kannavad kõik  $A$ -statistiliselt koonduvad tõkestatud jadad suvalisse jadaruumi. Siin on kirjeldatud maatrikseid, mis teisendavad antud  $BK$ -ruumi  $A$ -statistiliselt koonduvate tõkestatud jadade ruumi.

Analogously, using only Theorem C instead of Theorem B, we can prove the following characterization

**Theorem 2.** Let  $X$  be a separable  $BK$ -space with a countable linear limit and let  $\Phi$  be a countable fundamental set of  $X$ . Then

1.  $B \in (X, \mu(A) \cap m)$  if and only if  $\sup_n \sum_k |b_{nk}| < \infty$ .
2.  $B \in (X, \mu(A) \cap m)$  if and only if  $\lim_n \sum_k |b_{nk}| = c$  and  $\lim_n \sum_{k \in N} |b_{nk}| = 0$  for every  $N \in \mathcal{N}$ .
